Start by trimming off the modules from their sprues and remove all the tabs on all four sides of the modules. Lightly sand (emery board) the four sides of the modules to remove any burrs. Be sure to keep the edges square as you sand the sides smooth.

You will also see that there are several Evergreen strips which this kit uses. These strips are all cut to the same length so that you won’t have to worry about using the wrong length piece and then coming up short later on.

Notice that these pieces are different in size, so be sure not to use the wrong size when gluing together.
